BY BUREAU

(Continued from Page One.)

to arrest it, is shown by the exceedingly high death rates which prevail among infants under 1 year of age. Of 100,000 native white boy babies born alive, 4,275, or almost 5 per cent, die during the first month, an 412,602, or 12.5 per cent, die within one year. The girl baby's chance of life is considerably better; the death rate among native white females during the first month being 3,984 per 100,000 born alive, or less than 4 per cent, and during the first year 10,460 per 100,000, or nearly 10.5 per cent.

On its first birthday, however, the likelihood that a child will die within the year is only about one-fourth as great as it was at birth; the death rate among native whites during the second year being 2,841 per 100,000 for females and 2,610 per 100,000 for males. The rate continues to decrease until the twelfth year of life—that is, the period between the eleventh and twelfth birthdays—during which it is only 228 per 100,000 for males and 198 per 100,000 for females. This, the figures indicate, is the healthiest year of life among the native whites. Thereafter there is a continuous increase in the death rate from year to year. During the forty-eighth year of life, in the case of native white males, it is 1,267 per 100,000, or almost exactly what it was during the third year, 1,269; during the sixty-second year it is 2,919 per 100,000, or a little more than during the second year, 2,841; and during the eightieth year it is 12,154, or somewhat less than during the first year, 12,602. Similarly, among native white females the rate during the fiftieth year, 1,120, is a little less than during the third year, 1,144; dur-

ing the sixty-third year it is 2,548, or somewhat less than during the second, 2,610; and during the eightieth it is 10,901 per 100,000, or a little more than during the first, 10,460. The native white man at the age of 102 and the native white woman at the age of 99 have approximately the same prospect of dying within one month that they had at birth.

Median Age at Death.

To say that a person's expectation of life is a certain number of years is not the same as saying that he has an even chance of living that number of years. This is because, as already explained, expectation of life represents the average remaining length of life, at any given age, in a stationary population, whereas an average person in a given group has an even chance of living to what is called the median age at death, that is, the age below which half of the members of that group will die. The median age at death for all native white males in the assumed stationary population would be 60; that is to say, of a given number of such males born alive, half would die before reaching 60 and the other half at 60 and beyond. A native white male child at birth, then, has one chance in two of reaching this age. At the end of his first year, however, he has a trifle better than an even chance of reaching 64; and at 42 he has one chance in two of attaining three score and ten. Similarly, a native white female child at birth has an even chance of living a few months past the age of 64; at the age of 1 she has one chance in two of living until she is nearly 68 years old; and at 22 her chance of reaching 70 is an even one. Thus a native white man at 42 and a native white woman at 22 have about the same chances of celebrat-

ing their seventieth birthdays. City and Country.

The relative healthfulness of city and country is strikingly shown by the tables, according to which the death rate among white males under 1 year of age in cities having 5,000 inhabitants and over in 1909, and in cities of 10,000 and over in 1910 and 1911, is 13,380 per 100,000 born alive, whereas in smaller places the corresponding rate is only 10,326 per 100,000, or 23 per cent less than the rate for cities. A similar difference prevails with respect to white females under 1 year of age, for whom the death rate in cities is 11,123 per 100,000 born alive, while in rural localities it is only 8,497 per 100,000, or 24 per cent less than the urban rate.

For white males the expectation of life, at birth, in rural localities is 7.7 years greater than in cities; at the age of 19, 5.4 years greater; and until the age of 39 is reached there is a margin of more than five years in favor of the country. Thereafter the difference becomes gradually less, but is always in favor of the country until the age of 83 is reached, at and after which the cities show a slightly greater or longevity than the rural localities. For white females the difference between urban and rural longevity, while pronounced, is somewhat less than in the case of males. At birth the white female's expectation of life is 6 years greater in rural than in urban localities; at 10, 3.3 years greater; and until the age of 46 is attained the difference continues to be more than 2 years. Thereafter it declines until the age of 83 is reached, after which the cities have a slight advantage over the country.

FATHER OF MISSING
DOROTHY SCOFF'S STORY

By United Press.
New York, April 17.—Francis Arnold, father of the missing Dorothy Arnold, who disappeared six years ago, scoffed the story of Edward Glenoris, an inmate of the Rhode Island prison, that he aided in burying the body of Miss Arnold beneath a house at West Point. Glenoris said a wealthy man hired him to do the job.

FIFTH SUNDAY MEETING

Elder H. P. Haley announces the holding of the next Fifth Sunday meeting of the Chickasaw Baptist association will be at Macedonia church, 6 miles southeast of Tuttle, April 27, 28, 29. Every Baptist church in Grady county will be represented at the association and basket dinners will be served on the grounds of the meeting house every day. Conveyances will be furnished to transport those coming to the association by rail from Tuttle to the church.

WATCH CHILD'S COUGH.

Colds, running of nose, continued irritation of the mucous membrane if neglected may mean Catarrh later. Don't take the chances—do something for your child! Children will not take every medicine, but they will take Dr. King's New Discovery and without bribing or teasing. Its a sweet pleasant Tar Syrup and so effective. Just laxative enough to eliminate the waste poisons. Almost the first dose helps. Always prepared, no mixing or fussing. Just ask your druggist for Dr. King's New Discovery. It will safeguard your child against serious ailments resulting from colds.

OPENING ANNOUNCEMENT

"Children's Day" in our Millinery Section

On Wednesday Afternoon 4 to 6 o'clock we are preparing to entertain our little friends with a great exhibition of new lids for kids. Every girl in Chickasha from 4 to 15 years is, urgently invited to visit our Millinery department. This whole section will be devoted, during these hours, exclusively to the display of Headwear for children.

All of this season's new creations will be attractively displayed.
